

- 1. in order to interact with a system, we need to follow the principles and rules created by the system
- 2. internal details of a system can be hidden because most of the time we just need to know how to interact with the system, instead of knowing the internals of it.

- We as the backend engineers are going to expose the details of how any request is expected to be sent to the server. ----> contract
- We should make sure the details of the logics is abstracted (hidden) from the clients; they only need to know the way to interact with the system.

Network API --> there is some level of network interaction happening between the systems to interact with a functionality.

How to code an API ? (Network)

- SOAP Apis
 - REST Apis (most common)
 - rpcs -> grpc
 - and many more....
- REST -> gRPC -> GraphQL
- myflipkart.com/findUserAndMakePayment

REST APIs

- REST is a set of recommendations to create scalable and manageable apis.
- any data transfer should be facilitated through JSON

key - value pair based storage

Java script object notation

.json

```
{
  "DocumentType": 1,
  "No.": "S-ORD101001",
  "SellToCustNo": "10000",
  "PostingDate": "2023-04-02",
  "Lines": [
    {
      "LineNo": 10000,
      "Type": 2,
      "No": "1996-S",
      "Quantity": 12,
      "UnitPrice": 1397.3
    },
    {
      "LineNo": 20000,
      "Type": 2,
      "No": "1900-S",
      "Quantity": 4,
      "UnitPrice": 192.8
    }
  ]
}
```

1. Easy to read
2. Lang independent
3. data is more structured and segregated
4. Interoperable with most lang dependent alternatives
5. Lighter than XML

- Network protocol to be used will be http -> hyper text transfer protocol or https

- REST expects us to expose URI (uniform resource identifier)s

Ex: <https://myflipkart.com/users/22/order>

→ endpoint

myflipkart.com/index.html

google.com

- recommendations for how this endpoint looks like:

a. The endpoint should be resource oriented.

/users/22/orders

HTTP -> Hyper text transfer protocol

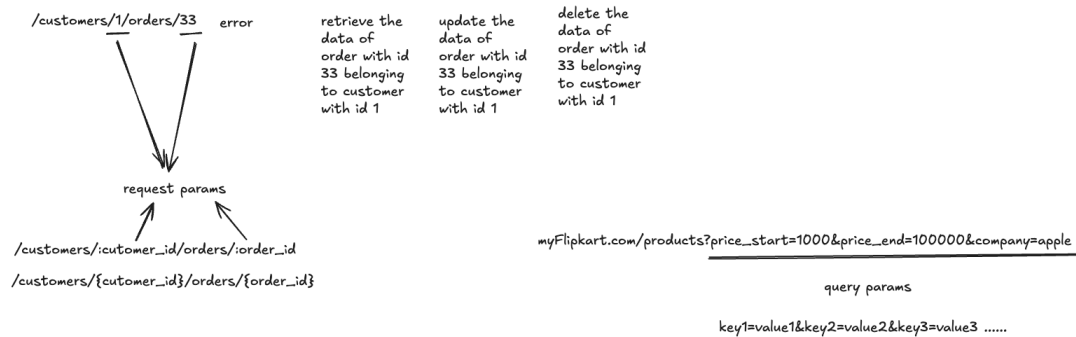

HTML -> Hyper text markup lang

`/users`
GET → Get the details of all the users

`/users/101`
GET → Get the details of user with id 101

Resource	POST	GET	PUT	DELETE
<code>/customers</code>	Create a new customer	Retrieve all customers	Bulk update of customers	Remove all customers
<code>/customers/1</code>	Error	Retrieve the details for customer 1	Update the details of customer 1 if it exists	Remove customer 1
<code>/customers/1/orders</code>	Create a new order for customer 1	Retrieve all orders for customer 1	Bulk update of orders for customer 1	Remove all orders for customer 1

ways to send data

1. Req body
2. request params →
3. query params
