

CRUD APIs (REST standards)

CREATE
READ
UPDATE
DELETE

Gateway -> external api interaction

```
class FakeStoreGateway {
    String baseUrl = "https://www.fakestoreapi.com"
    ...
}
```

1. Created a plain .env file and added that to .gitignore
this ensured that this file is not tracked by VC

2. Put the env variable value in the .env file -> PORT=3000

3. In the application.properties access the port from env variables using \${PORT}

4. Before running the server, load the .env file and populate the env variables

5. Run the server

----> Routing ----> Controller -> service ----> gateway

@RestController ----> @Controller (Semantic purpose) ----> @Component
